

SUMMARY

DevOps Engineer with 4+ years of experience in infrastructure management, CI/CD automation, containerized deployments, monitoring, and production operations. Experienced in Docker, GitHub Actions, GitLab CI/CD, Linux, Nginx, PostgreSQL, Microsoft SQL Server, Elasticsearch, Redis, Grafana, and Prometheus. Proven ability to design deployment and monitoring solutions, troubleshoot production systems, and coordinate cross-functional development and infrastructure teams while supporting Technical Lead and Project Management responsibilities. Focused on building secure, reliable, automated, and maintainable infrastructure.

EXPERIENCE

Ministry of Education and Culture Republic of Indonesia | Contract Junior DevOps

August 2021 – December 2026

- Managed application infrastructure and operations, including API services, deployments, monitoring systems, source code repositories, and production environment support across multiple applications.
- Designed and maintained automated CI/CD pipelines using **GitHub Actions**, **GitLab CI/CD**, **Docker**, and **Bash**, reducing manual deployment processes and improving deployment consistency across development and production environments.
- Managed containerized application deployments using Docker and **Docker Swarm**, including service configuration, image versioning, environment management, rolling updates, and production troubleshooting.
- Built and maintained a private Docker registry for PDDikti, providing centralized and controlled storage for application container images used across development and deployment workflows.
- Designed and implemented infrastructure monitoring solutions using **Grafana**, **Prometheus**, **VictoriaMetrics**, **Alertmanager**, **Blackbox Exporter**, **Node Exporter**, and **cAdvisor** to monitor application availability, server resources, and service performance.
- Managed and supported infrastructure components including **Linux servers**, **Nginx**, **SSL/TLS certificates**, **reverse proxies**, **DNS**, and application networking across multiple environments.
- Supported and maintained data infrastructure involving **PostgreSQL**, **Microsoft SQL Server**, **Elasticsearch**, and **Redis**, including troubleshooting connectivity, performance, replication, and application integration issues.
- Designed DevOps and infrastructure architecture diagrams based on application and operational requirements, and presented proposed solutions, implementation approaches, and technical trade-offs to stakeholders and engineering teams.
- Coordinated cross-functional teams across software development, infrastructure, and operations, while taking additional responsibilities similar to **Technical Lead**, **Project Manager**, and **Engineering Manager** for selected projects.
- Planned technical implementations, coordinated task execution, identified infrastructure risks and dependencies, and ensured solutions were aligned with application requirements and operational constraints.
- Supported production incident investigation and troubleshooting across application, container, database, networking, and infrastructure layers to maintain service reliability and availability.
- Contributed to DevSecOps practices by integrating deployment validation, vulnerability/security testing, infrastructure monitoring, and operational controls into application delivery workflows.

EDUCATION

Bachelor of Electrical Engineering | Udayana University

July 2018 – July 2022

Majoring in Telecommunication and Multimedia Networking with GPA: 3.86/4.00.
